## ///5.5.3 节 算法 NorecPreOrder

```
template<class T>
void Tree<T> :: NorecPreOrder (TreeNode<T> * t )
{
    if (t==NULL) return;
    AStack < TreeNode<T> * > s ;// s 是元素类型为树结点的栈
    TreeNode<T> *p = t;
    do
    {
                                           // 循环 (1)
         while ( p != NULL )
             cout<< p ->GetData() <<endl;</pre>
                                            // 访问结点 p
             s.Push (p);
                                             //结点 p 入栈
             p = FirstChild ( p );
         while ( p == NULL &&!s.IsEmpty()) // 循环(2)
         {
             s.Pop ( p );
             p = NextBrother ( p );
                                          // 循环 (3)
    } while (!s.IsEmpty());
};
```
